

8folios.com enables your organization to easily build and maintain blueprints that connect the portfolios of IT. Capture *things* and dependencies between *things*. Then use our distinctive analytics to achieve better results.

Three IT challenges, and how to help solve them with 8folios:

Legacy Application Management

Mitigate risks related to aging mainframe applications using our innovative approach.

Approach:

1. Use Legacy Software's proven solution to automatically identify dependencies between programs, copybooks, DB2 tables and columns, VSAM files, JCL jobs, and more. www.legacysoftware.co.uk
2. Import that information into 8folios using our Data Connector to Legacy Software.
3. Build on this information with Data Management or Portfolio Management.

Value:

- Accurate documentation of dependencies.
- Use the information to plan, including any phased transitions to newer platforms.

Portfolio Management

Coordinate management of applications, integrations, technologies, and more. Manage obsolescence. Pinpoint risks.

Approach:

1. Identify major technologies such as databases and operating systems.
2. Identify the critical applications.
3. Identify related applications, integrations, and technologies.
4. Create dependencies.

Value:

- Application, Integration, and Technology Roadmaps. Communicate lifecycles.
- Forecast technical debt and proactively manage end-of-life risks.
- Major upgrades have no omissions.
- Demonstrate effective asset controls to auditors and leadership.
- Have detailed and factual information for budget requests.

Data Management

Identify data and platforms but don't boil the ocean - focus on logical data, not physical.

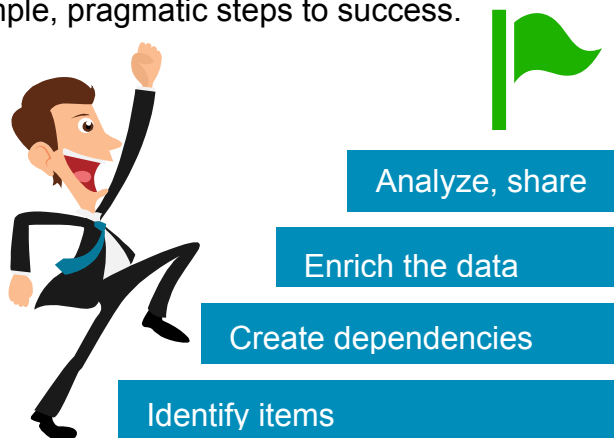

Approach:

1. Identify logical data entities.
2. Identify logical attributes with sensitive information such as PCI, PHI, or PII.
3. Identify applications and integrations.
4. Create dependencies, identify where data is persisted, and identify where data is created, changed, read, or deleted.

Value:

- Information Roadmaps, including lineage.
- Information-to-Platform blueprints, needed for transformation activities.
- Identification of potential compliance risks.
- Identification of unencrypted-data risks.
